

Methodological Notes and Usage of MB-Research Market Data

By using MB-Research International Data researchers are able to

- Quantify regional market potentials
- Judge areas as to their strengths and weaknesses
- Identify unused market potential
- Focus locally on marketing activities
- Set realistic local economic forecasts

To avail data on internationally comparable geographical levels, and to be able to use it in Geographical Information Systems, data are compiled on administrative, postcode and micro levels compatible to existing available boundaries.

To furnish users with a broad variety of data for different sets of tasks, various indicators for regional demand are compiled:

- Population
- Extended Sociodemographics (households, household size, households by type, sex and age, education, marital status and unemployed)
- Households by Income
- Purchasing Power (disposable household income)
- Consumer Spending data by product groups

Population figures are shown as projected averages for current year on the basis of official statistics. They are represented in absolute numbers and per mille shares (thousandth part) of the whole country.

Population variables:

ID	Postal code or Administrative code or Micro-code
NAME	Administrative level: name of administrative area Micro level: Name of the respective micro-area or the next higher level Postcode level: Name of the most populous administrative area
P_T	Population year average: total number
P_PRM	Population year average: per mill of country

Extended Sociodemographics: For the purpose of target group specific consumer analyses or general profiling of the areas a number of variables can be provided on the basis of official statistics, depending on availability: number of **households**, **household size**, **households by type**, **sex and age** structure, **education**, **marital status** and **unemployed**.

The resident population by sex and age groups is useful for targeting potential customers, whose products are mainly designed for certain age groups.

Extended Sociodemographic variables:

MALE	Population: males
FEMALE	Population: females
HH_T	Households: total number
HH_SIZE	Average household size
AGE_T0014	Population by age: 0 - 14 years, total
AGE_T1529	Population by age: 15 - 29 years, total
AGE_T3044	Population by age: 30 - 44 years, total
AGE_T4559	Population by age: 45 - 59 years, total
AGE_T60PL	Population by age: 60 years and above, total
AGE_M0014	Population by age: 0 - 14 years, male
AGE_M1529	Population by age: 15 - 29 years, male
AGE_M3044	Population by age: 30 - 44 years, male
AGE_M4559	Population by age: 45 - 59 years, male
AGE_M60PL	Population by age: 60 years and above, male
AGE_F0014	Population by age: 0 - 14 years, female
AGE_F1529	Population by age: 15 - 29 years, female
AGE_F3044	Population by age: 30 - 44 years, female
AGE_F4559	Population by age: 45 - 59 years, female
AGE_F60PL	Population by age: 60 years and above, female
MA_1	Marital Status: single
MA_2	Marital Status: married
MA_3	Marital Status: divorced
MA_4	Marital Status: widowed
UNEMPL	Unemployed persons

Households by Type

Variable structures are country-specific (e.g. one person household, multi person household, couple household ...)

Education

Variable structures are country-specific (e. g. primary education, secondary education, university degree ...)

Households by Income

On the national level the number of households is distributed into 5 classes according to their disposable household income with an equal number of households in each class. The first quintile represents the 20 % households having the lowest income (on a national level), the fifth quintile represents the 20 % households with the highest income (on a national level) in each area.

Household Income variables:

HH_I1	Households in 1st (lowest) Income Quintile, total
HH_I2	Households in 2nd Income Quintile, total
HH_I3	Households in 3rd Income Quintile, total
HH_I4	Households in 4th Income Quintile, total
HH_I5	Households in 5th Income Quintile, total

Purchasing Power Indices are a suitable indicator for the distribution of all products and services, whose demand depends largely on consumers' incomes. Sales figures of consumer goods, durable goods, personal services or homes are to a large extent a function of purchasing power. So Purchasing Power Indices are used for regional market calculation by consumer goods manufacturers, retailers, banks, insurance companies, saving banks and consumer-oriented service providers.

Purchasing Power refers to the disposable income (i.e. income after taxes and social contributions, including received transfer payments) of a certain region's population. Consequently Purchasing Power consists of net incomes from employment and assets (after taxes and social contributions), pensions, unemployment benefits, benefit payments and other national transfer payments.

MB-Research uses information from national or regional state agencies on regional income distribution in the form of tax statistics. Indicators corresponding highly to income (wages and salaries, household equipment and endowment, demographics, unemployment etc.) were also compiled and used for purchasing power calculation by means of statistical methods.

A per capita index of 100 indicates the area's purchasing power is in line with the national average and index above or below this average shows the amount of deviation from the average, positively or negatively.

Purchasing Power variables:

PP_CTRY	Purchasing Power: in country's currency
PP_PRMCTRY	Purchasing Power: per mill of country's currency
PP_PCCTRY	Purchasing Power: per capita in country's currency
PP_IDXCTRY	Purchasing Power: index (country eq.100)

Consumer Spending data by categories monitor the expenditures of consumers for the various products and services. The target of these data evaluations is the expenditures for the products and services as such, no matter from which sector consumers acquire these products and services. The ratio between disposable income, demographics and expenditures for the products and services are derived from Household Budget surveys from the National Statistical Offices. By using such representative surveys and the regional and local statistics about income strata and demographics, Consumer Spending data is calculated.

To determine market sizes, also household final consumption expenditure data by categories within the System of National Accounts were used. These data include estimates from the Statistical Offices for the 'grey economy'. Consumer spending also includes estimates for consumption of own produced products and buying directly from the manufacturer.

Categories

To protect users from methodological problems typical for work with regional data from different sources, the regional raw data (on bases of research at the national statistical offices, in some countries also regional statistical offices) were adjusted to national figures from internationally comparable data sources (UN, ILO, EUROSTAT and other international organisations).
