

Supporting information for the currently active, Esri Vector Basemaps (Production v2 service URL):

https://basemaps.arcgis.com/arcgis/rest/services/World_Basemap_v2/VectorTileServer

This document reflects the current **Production v2 vector tile maps** (on ArcGIS.com since December 6, 2017). This information supersedes the previous information related to the v1 tile set. Our [v1 tile set is retired](#). Refer to the [Esri blogs](#) for more information on the latest Esri vector basemap information and the ability to customize them for your own web maps and apps.

[Esri Vector Basemaps Release Updates](#) Page 2

[Esri Vector Basemaps Web Maps and Tile Layers](#) Page 3

[Difference between v2 and v1 service URLs](#) Page 4

[Feature Names and Label Subtypes](#) Pages 5 – 13

This provides a list of the feature id, subtypes and label information found in the root.JSON file. Knowing what the feature names are from this list is beneficial when editing the JSON code to stylize and customize your vector basemap.

[Min/Max Zoom Levels | Symbols & Labels](#) Pages 14 – 20 & 21 – 25

The list below shows the current full list of feature names (“id”) and their corresponding min and max zoom levels. You can control when features appear on the map by adjusting the “minzoom” and “maxzoom” values in the root.JSON file.

[Disputed Boundaries and Labels with IDs](#) Pages 26 – 30

See [this blog](#) for an example of how to change the JSON code and apply the DisputeID code in the filter for boundary lines.

[Resources\Fonts and Customizing Esri Vector Basemaps \(Including Localization\)](#) Page 31 – 37

See [this blog](#) for an example of how to change the JSON code and apply different fonts to your map style. Follow this step-by-step approach to make a font change. There are 136 fonts available for use in your customized maps.

[Open Street Map data sources](#) Page 38

Esri Vector Basemaps contain commercial data primarily from TomTom, community contributions of authoritative data, and a collection of data from open sources including Open Street Map. The spatial extent and method of processing OSM data is detailed in this section.

[Localization of Esri OpenStreetMap Daylight Distribution vector tile maps \(non-Esri Vector Basemap\)](#) Page 39

Esri Vector Basemap Releases

Current v2 Updates to World_Basemap_v2, World_Basemap_Export_v2, and/or World_Basemap_GCS_v2:

Jan. 3, 2024: WMA, Export, & GCS Vector tile sets updated.

New commercial source *TomTom* replaces *HERE* data.

New & updated contributions from Community Map Program & OpenStreetMap Daylight sources.

Previous Updates

2024: *see above*

2023: 9 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

World_Hillshade_v2 updated with large-scale Europe coverage (beta).

New Tile Layers (styles) & Web Maps: [New Places styles launched](#) (beta).

Updated fonts (see page 31 for full list).

2022: 17 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

Additional localized language basemaps released (see page 35): Bulgarian.

Updated cooking software to create tiles with Pro 2.8.3. [Known limitation with Runtime 100.4 & 100.5](#) (since retired) and Enterprise 10.6.1 Printing.

New Tile Layers (styles) & Web Maps: [Outdoor Map \(beta\)](#), [Topographic \(with Contours and Hillshade\) \(beta\)](#), [Enhanced Contrast](#), & [Enhanced Contrast Dark](#).

Supplemental beta services released: [World_Hillshade_v2](#) (global small-scale and North America large-scale) and [World_Contours_v2](#) for support of multisource basemap styles/layers.

[Places \(points of interest\)](#) updated with new sources (SafeGraph for US & Canada; Foursquare for rest of world).

Select style updates.

Additional fonts (see page 31 for full list).

v1 and Beta2 (b2) [vector basemaps retired](#).

2021: 17 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

WGS84 services/styles available for Export.

Additional localized language basemaps released (see page 35): Bosnian, Catalan, Croatian, Hungarian, Indonesian, Serbian, Slovak, Slovenian.

Updated Label Point/Admin0 DisputelD and boundary DisputelD codes (see pages 26-31).

Select style updates.

2020: 16 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

Additional localized language basemaps released (see page 35): Danish, Dutch, Norwegian, Portuguese (Portugal), Romanian, Ukrainian.

Updated boundary DisputelD codes (see page 26-31).

Select style updates.

2019: 17 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

Integration of [Vector Tile Style Editor](#) into ArcGIS.com Map Viewer.

Additional localized language basemaps released: Czech, Finnish, Hebrew, Swedish, Turkish.

Updated boundary DisputelD values (see chart starting on page 26). [Blog post](#).

New Tile Layers (styles) & Web Maps: [Navigation \(Dark Mode\)](#), [National Geographic Style map](#) & [Watercolour](#).

Expanded Community Maps styles, WGS84/GCS styles. [Blog post](#).

Select style updates.

Additional fonts (see page 31 for full list).

2018: 17 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

Initial release of localized language basemaps: Arabic, Chinese (Hong Kong), Chinese (Simplified), Chinese (Taiwan), French, German, Italian, Japanese, Korean, Polish, Portuguese (Brazilian), Russian, Spanish.

New Tile Layers (styles) & Web Maps: [Chartered Territory](#), [World Ocean Reference](#), & [Ocean Basemap](#).

Select style updates.

Additional fonts (see page 31 for full list).

2017: 2 basemap releases of updated commercial, contributor, and open-source content. Notable content changes:

Release new service URL [updated to v2](#) ([current map: World_Basemap_v2](#)) [Blog](#).

Previous vector basemap services released are [retired & no longer available v1 Updates](#).

Additional attribution for data Contributor: Geospatial Information Authority of Japan (GSI)

Description: Fundamental Geospatial Data, Approval Number JYOU-SHI No.1239 2016.

Esri Vector Basemaps Web Maps and Tile Layers

Web maps are available in default Esri Vector Basemap – Tile layers

WMA (Web Mercator Axillary scheme), for Export, and also available in GCS (WGS84)

Group: (WMA): <http://www.arcgis.com/home/group.html?id=30de8da907d240a0bccd5ad3ff25ef4a#overview>

World Topographic Map – designed for use with raster World Hillshade

World Street Map

World Street Map (with Relief) – designed for use with raster World Hillshade

World Street Map (Night)

Navigation

Navigation (Dark Mode)

National Geographic Style – designed for use with raster National Geographic Style Base and World Hillshade

Currently National Geographic Style only available in WMA

Hybrid Reference – designed for use with raster World Imagery

Light Gray Canvas (Light Gray Reference, Light Gray Base)

Dark Gray Canvas (Dark Gray Reference, Dark Gray Base)

Terrain with Labels (Terrain Reference, Terrain Base) – designed for use with raster World Hillshade

Ocean Basemap (World Ocean Reference, Ocean Base Map) – designed for use with raster Ocean Base Map

Currently World Ocean Base only available in WMA and for Export

Additional Esri Vector Basemap Styles

Charted Territory – designed for use with raster World Hillshade

Colored Pencil

Enhanced Contrast (Base/Reference)/Enhanced Contrast Dark (Base/Reference)

Human Geography (Labels, Detail, Base)

Community

Human Geography Dark (Labels, Dark Detail, Dark Base)

Nova

Outdoor – multi-source map with vector hillshade and vector contours (beta)

Modern Antique

Mid-Century – designed for use with raster World Hillshade

Watercolour

World Topographic (with contours and hillshade) – multi-source map with all vector components (beta)

Name of style (Local Language) = Local language within each country at large scale (where data available)

Name of style (Community Maps) = Contributor authoritative Road and Admin data rather than commercial data

Name of style (WGS84) = uses WGS84 / GCS tiling scheme as opposed to others that are Web Mercator Aux Sphere

Esri vector basemaps are available in the following languages: see page 35

Esri Vector Basemaps Difference between v2 and v1 map versions

There are several differences between the active v2 vector basemaps (Dec. 2017 – present) and the retired v1 tiles (Dec. 2016 – Dec. 2017) or retired beta tile sets b1 or b2 (pre-Dec. 2016).

How does this change to v2 affect me?

It depends on how you are consuming the Esri Vector Basemaps.

- If you're using the Web Maps – you will automatically get the v2 tile set seamlessly.
- If you're using the Tile Layers in your own maps or apps – you will need to update that tile layer to the corresponding v2 tile layer. The v1 items are now in Mature Support and will no longer be updated. The v2 items are what will be updated with each release.
- If you've customized an Esri Vector Tile Layer – to take advantage of using the latest vector tiles, update the tile layer in use to the new v2 set and re-apply your customizations.

Commercial or Community Features

New to the v2 version of the vector basemap styles, the roads, administrative lines, and ferries provided by contributors to the Esri Community Maps Program are now included in the tile set available at the new v2 service URL. Other features contributed by the authoritative community data stewards (POI, buildings, etc.) are included in all styles.

The v2 Topographic Map (Web Map, Tile Layer) displays Roads and Road Shields, Administrative lines, and Ferries provided by community contributors. This presents the topographic map as the Community Basemap (similar to the raster version of the Topo map). These features (Roads and Road Shields, Administrative lines, and Ferries) all have a specific JSON filter code to display the community data. In the Topo map, the code is:

```
"filter": ["all", ["==", "_symbol", #], ["!in", "Viz", 2]]
```

The v2 Street, Navigation, Hybrid, Canvas, and other Esri Vector Basemap styles contain the commercial Roads and Road Shields, Admin lines, and Ferries. This use of commercial roads works well with routing and geocoding services. These features (Roads and Road Shields, Administrative lines, and Ferries) all have a specific JSON filter code to display the commercial data. In the Street, Navigation, Hybrid, Canvas and other non-Topographic maps, the code is:

```
"filter": ["all", ["==", "_symbol", #], ["!in", "Viz", 3]]
```

Service URL

The service URL for the tile set has changed. The new v2 Tile Layers are all updated to reference this service URL:

https://basemaps.arcgis.com/arcgis/rest/services/World_Basemap_v2/VectorTileServer

Other Changes

Additionally, there are changes to the map styles, found in the JSON code in the v2 Tile Layers. This continues our improvements to the vector basemaps.

Canvas basemaps (Base and Reference layers) – we've made some style improvements to both the Dark and Light Gray Canvas Base and Reference layers. The main change is all the reference information, all the type and shields, are now found on the Reference Layer. All other features (land, admin lines, water, etc.) except labels are now found on the base layers. Additional changes to the cartographic styles were applied to the Canvas maps for this release.

Road Shield Ordering – we've reordered the display of our road shields for our v2 styles to allow the shields of more prominent roads to display more clearly.

Overall style updates applied to the basemap.

Esri Vector Basemaps Feature Names and Label Subtypes

Features have the ability to be displayed and/or labeled. A feature is identified by its **“name”** in this document. In the root.JSON it can be found in the first part of the **“id”** field, e.g. **“id” : “Road”**. Some features are subdivided by type or label type. The feature subtypes are listed in the **“symbols”** section in this document. In the root.JSON they can be found in the second part of the **“id”** field, e.g. **“id” : “Road/Local”**. The feature labels subtypes are listed in the **“labels”** section in this document. In the root.JSON they can be found in the **“id”** field by looking for the feature, label keyword and label descriptor subtype **“id” : “Road/label/Local”**.

BACKGROUND (controls background color – not a feature but acts like one, background is also the equivalent of Bathymetry depth 1)
name: “background”

LAND AND OCEAN

name : “Colormap/#/1” < new as of June 27, 2018 (Admin0 polygons at small scale, only appears in Charted Territory map style, but code from this map’s root.json can be added to any World_Basemap_v2 vector basemap)

symbols : (random color polygons for Admin0, national level) (There are currently no features symbolized with Colormap/9/1)

“1”	“6”
“2”	“7”
“3”	“8”
“4”	“9”
“5”	

name : “Land”

symbols : “Not ice”, “Ice”, “Inlet” (“Inlet” is no longer a functional symbol value and is not to be used in map styling)

name : “Continent” *label only

labels : “Default”

name : “Bathymetry”

symbols :

“depth 2 (shallow water)”	“depth 5”
“depth 3”	“depth 6”
“depth 4”	“depth 7 (deep water)”

name : “Marine area” (Bathymetry depth 1)

labels : “Default”

name : “Marine waterbody” (labels only small scale sea and ocean)

labels :

“2x large”	“medium”
“x large”	“small”
“large”	

name : “Ocean area” (labels only sea and ocean) << New Oct. 17, 2018 with new World Ocean Reference tile layer

labels : (Oblong labels along a line, Round labels horizontally; black text are landforms, blue text are waterbodies)

“Oblong 2x large black text”	“Round 2x large black text”
“Oblong x large black text”	“Round x large black text”
“Oblong large black text”	“Round large black text”
“Oblong medium black text”	“Round medium black text”
“Oblong small black text”	“Round small black text”
“Oblong 2x large blue text”	“Round 2x large blue text”
“Oblong large blue text”	“Round large blue text”
“Oblong large blue text”	“Round large blue text”
“Oblong medium blue text”	“Round medium blue text”
“Oblong small blue text”	“Round small blue text”

name : “Ocean point” (labels only sea and ocean landforms and depth values) << New Oct. 17, 2018 with new World Ocean Reference tile layer

labels :

- “Black text”
- “Blue text”
- “Depth”
- “Seamount depression”
- “Seamount rise”

name : “Coastline”

 "Waterbody"

Esri Vector Basemaps Min/Max Zoom Levels | Symbols & Labels

Some features only display at certain map levels. They may first appear at a small- or mid-scale as you zoom in and stay visible on the map down to the largest scale, or they may turn off at a certain scale level. The first scale a map becomes visible is its “minzoom”.

The last scale a map is visible is its “maxzoom”. The smallest map scale is “minzoom” : 0 (or ~1:295million scale). The largest map scale is currently “maxzoom”: 18 (or ~1:1,000 scale). Some clients (ArcGIS.com map viewer, ArcGIS Pro, etc.) will overzoom the map image to 1:70 scale (level 22). The list below shows the current full list of feature names (“id”) and their corresponding min and max zoom levels. As an example, Urban area first appears on the map at Level 5 (“minzoom”: 5 or ~1:9million) and is last seen on the map display at Level 15 (“maxzoom” : 15 or ~1:9,000). You can control when features appear on the map by adjusting the “minzoom” and “maxzoom” values in the root.JSON file.

Esri Vector Basemaps Min/Max Zoom Levels | Symbols

SYMBOL ID (Feature layer name)	minzoom	maxzoom
Background	(displays at all zoom levels)	
Land/Not ice	0	18

Esri Vector Basemaps Disputed Boundaries with IDs

The source Esri Community Map data used to build the vector tiles has disputed boundaries defined for many areas around the world. In the Esri vector basemaps, internationally recognized national boundaries (e.g. United States / Canada border) are typically represented with different types of “solid” lines while **disputed boundaries** (e.g. parts of French Guiana / Suriname border) are typically represented with “dashed” lines. In some cases, a country will want to not render (i.e. make invisible) a disputed boundary that it does not recognize. See [this blog](#) for an example of how to change the JSON code and apply the DisputeID code in the filter for boundary lines. This [web map](#) details all the disputed boundaries, with DisputeID codes, configured in the Esri Vector Basemaps.

Disputed IDs and Boundaries			Display Hints (add DisputeID value to filters to change appearance)		
DisputeID	Admin level	Disputed Boundary	Dashed	Solid for	Invisible for
1	Admin0	China / Russia	(default map view)	Non-disputed display	None

Esri Vector Basemaps Disputed Labels with IDs

The source Esri Map data used to build the vector tiles has select disputed or alternate labels defined for many areas around the world. In the Esri vector basemaps, internationally disputed features are typically represented with no label. In some cases, a country will want to render a specific name to the feature. See [this blog](#) for an example of how to change the JSON code and apply the DisputeID code in the filter. A quick example is to apply DisputeID of 1001 in the Disputed Waterbody feature (to the root.json) which would label it as the 'Sea of Japan'

Layer	DisputeID	EsriPolicy	name_lc	_name_en	name
Admin0	1021	Global view of Western Sahara (on by default)	ENG	Western Sahara	Western Sahara
Admin0	1100	Alternate label of United States on Hawaii	ENG	United States	United States

Esri Vector Basemaps Resources\Fonts

For each of the [Esri Vector Basemap Tile Layers v2](#), there are a set of fonts available to customize styles of the layers. This lists 136 fonts currently in the directory resources\fonts. The styles\root.json file applies the fonts for map display. These are the current service level fonts possible for display in Esri Vector Basemaps. The exact name (including spaces but excluding footnotes) must be used when changing font names in the tile layer style root.json. Open source fonts and license: https://scripts.sil.org/cms/scripts/page.php?site_id=nrsi&id=OFL

For Export layers only include fonts applied through the resources\styles\root.json file. For Export layers not intended to display non-Roman glyphs.

1 – These Arial fonts are the default fonts in the Esri basemap styles: [World Street Map](#), [World Street Map \(with Relief\)](#), [World Street Map \(Night\)](#), [World Navigation Map](#), [World Navigation Map \(Dark Mode\)](#), [World Terrain with Labels](#), [World Terrain Reference](#), [Hybrid Reference](#).

2 – This Arial font is also a default font in the Esri basemap styles: [World Terrain with Labels](#) & [World Terrain Reference](#)

3 – These Noto and Roboto fonts are the default fonts in the Esri basemap style: [Topographic](#)

4 – These Ubuntu fonts are the default fonts in the Esri basemap styles: [Dark Gray Canvas Reference](#) & [Dark Gray Canvas](#)

5 – These Ubuntu fonts are the default fonts in the Esri basemap styles: [Light Gray Canvas Reference](#) & [Light Gray Canvas](#)

6 – These Noto fonts are the default fonts in the Esri basemap style: [World Ocean Reference](#)

7 – These fonts are the default fonts in the Esri basemap style: [National Geographic Style](#)

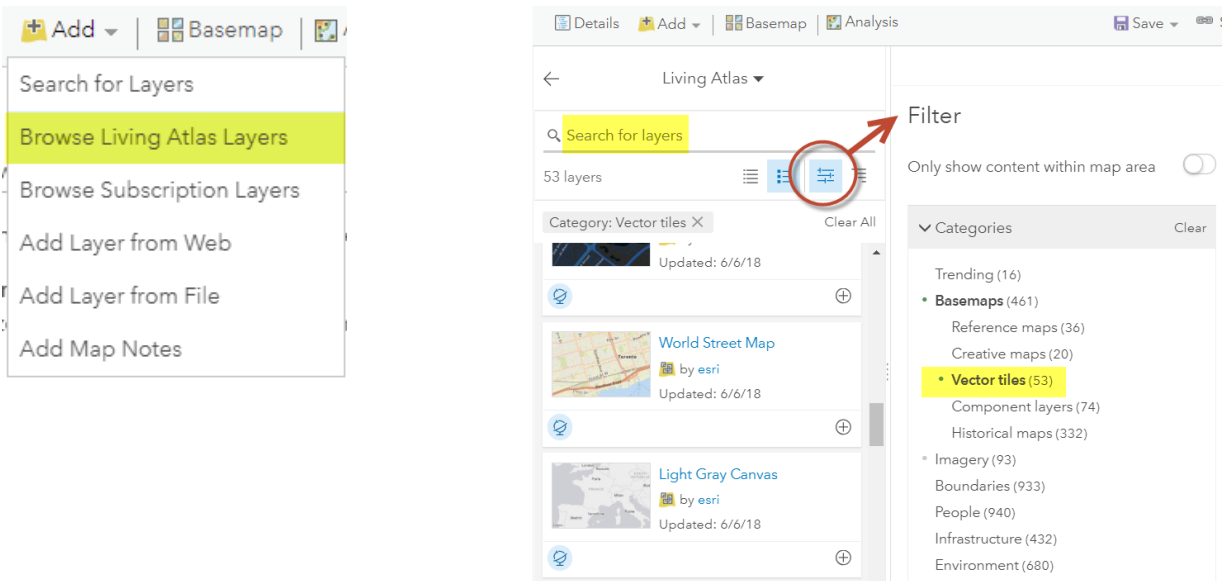

9 – Arial Unicode MS Bold & Regular can be used with fallback fonts (font stacking) because they contain a large set of non-Roman glyphs. Font fallback (font stacking) is not applied in these core map styles at this time. Font stacking can be applied to the root.json if you use the latest Esri clients to view the map.

Customizing JSON for Esri Vector Basemaps

There is now an application for customizing the Esri Vector Basemaps. [ArcGIS Vector Tile Style Editor](#) Details of the app are provided in the description section of the item page.

Additionally, you can edit the json directly through the following steps. Once you decide on the features to edit (change viz value, change font), the next step is user customization of the **root.json** file. A step-by-step set of instructions:

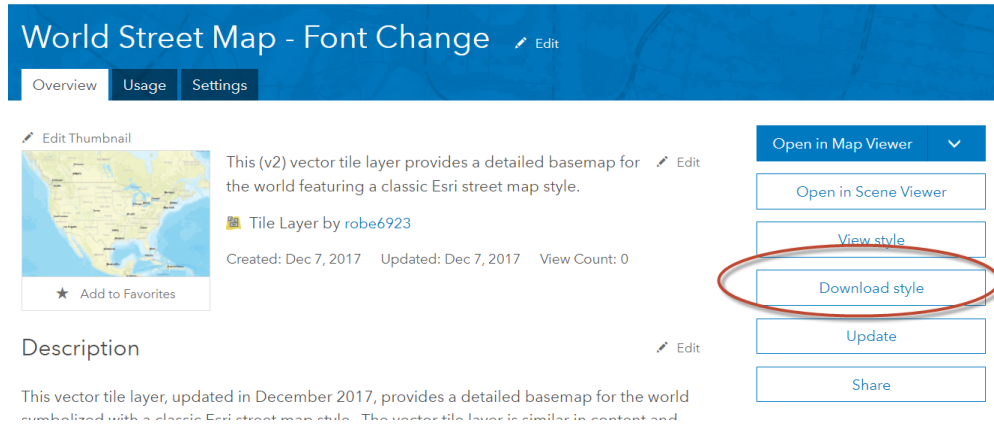

- 1) Sign in to [ArcGIS.com](#)
- 2) Go to a new **Map**
- 3) **Add > Browse Living Atlas Layers**
- 4) **Filter > Categories > Basemaps > Vector tiles**; Add your tile layer by esri (this example adding World Street Map) **(+)** to add

- 5) Under the layer name, pull down the **...** and **Copy** the layer. Under the new layer name (World Street Map – copy) **Save Layer**
- 6) Select a name for this new layer (e.g. **World Street Map – Font Change**) and into your choice of folder in your ArcGIS.com account.

- In **My Content**, navigate to this new item, click on the name to go to the **item page**. **Download style**. This saves a root.json file for the style.

- Open the **root.json** file (any text editor, but suggest using [Brackets](#)). Select all, Copy and Paste into [jsonlint.com](#) to validate and parse the JSON. Copy and paste from the web browser window back into the text editor and save as **root.json** (overwrite your download).

Editing the json. For this example we'll change the font for:

"source-layer": "Admin0 forest or park/label" from Arial Regular to Palatino Linotype Regular

Also, we'll change the text color from green to red for good measure:

"text-color": "#797859", (existing green) to "text-color": "#ff0000", (red color, so new is easy to see change)

```

{
  "layout": {
    "text-letter-spacing": 0.05,
    "text-font": [
      "Arial Regular"
    ],
    "text-max-width": 8,
    "text-field": "{_name_global}",
    "text-size": 10,
    "symbol-avoid-edges": true,
    "text-padding": 25
  },
  "source-layer": "Admin0 forest or park/label",
  "id": "Admin0 forest or park/label/Default",
  "source": "esri",
  "paint": {
    "text-halo-color": "#DAE0B2",
    "text-color": "#797859",
    "text-halo-width": 0.665
  },
  "minzoom": 6,
  "type": "symbol"
},

```

```

{
  "layout": {
    "text-letter-spacing": 0.05,
    "text-font": [
      "Palatino Linotype Regular"
    ],
    "text-max-width": 8,
    "text-field": "{_name_global}",
    "text-size": 10,
    "symbol-avoid-edges": true,
    "text-padding": 25
  },
  "source-layer": "Admin0 forest or park/label",
  "id": "Admin0 forest or park/label/Default",
  "source": "esri",
  "paint": {
    "text-halo-color": "#DAE0B2",
    "text-color": "#ff0000",
    "text-halo-width": 0.665
  },
  "minzoom": 6,
  "type": "symbol"
},

```

- Save the file (same name: **root.json**).

- On the **Map Item** page, there's an **Update** button. Update the style with the latest **root.json** file you just modified & saved.

- Open the tile layer in a web map browser and zoom to Yellowstone National Park. You should quickly see the park type (**Admin0 forest or park/label**) shows as red and in a different font (**Palatino Linotype Regular**).

Localization of Esri Vector Basemaps

Esri Vector Basemaps supports the ability to localize select map labels in many languages. The default map displays a primarily English global view. Localization is another form of basemap customization. As with other customization, there are two main ways to create a style for customization: add a style to the map in the Map Viewer or copy a root.json style from the USB flash drive. Review the information in the previous section on how to Customize Esri Vector Basemap styles.

Localization changes the labels on the map for many of the small scale features where the data supports it. Localize the map by changing the "text-field" value of the map style's resources\styles\root.json file. Use the corresponding codes for the language you wish to display. It is also recommended to change all "text-font" to an Arial Unicode font ("Arial Unicode MS Regular" or "Arial Unicode MS Bold") to allow all glyphs to display in the map. After the localization changes are applied to your JSON, validate the JSON using <https://www.jsonlint.com> or a similar tool, and then update or upload the new localized map style as previously detailed in this reference document.

Languages and codes supported (40 to date)

Arabic ar	Dutch nl	Italian it	Russian ru
Bosnian bs	English (default)	Japanese ja	Serbian sr
Bulgarian bg	Estonian et	Korean ko	Slovenian sl
Catalan ca	Finnish fi	Latvian lv	Slovak sk

Croatian hr	Hebrew he	Portuguese (Brazil) pt_b	Turkish tr
Czech cs	Hungarian hu	Portuguese (Portugal) pt_p	Ukrainian uk
Danish da	Indonesian id	Romanian ro	Vietnamese vi

Features supported for localization

The following features can have their "text-field" values changed to support these languages. The map labels that can be localized are primarily features displayed at small scale. At large scale, the default JSON labels the map in English "{_name_global}". You can change it to the local language "{_name_local}" within each country where the map data supports it at large scales.

Apply the Small Scale Feature changes first, before any changes to Large Scale Features.

Using a text editor, find each "id" name and change its "text-field" value accordingly.

Small scale features

The default JSON for these features is "text-field": "{_name_global}" or "{_name}". Listed below are the 88 "id" fields in the worldtopomap style JSON available for localization where the data supports it at primarily small scales. Other styles may have all or fewer of these features. To display the map in modern Chinese, for example, the JSON for each of these features changes "text-field":

See the charts on the next page for the layer id values that can be converted for any of the supported languages.

"text-field": "{_name_global}" to "text-field": "{_name_zh_s}". For French, "text-field": "{_name_fr}", and so on.

Water point/Sea or ocean	Water point/Bay or inlet	City large scale/town small
Water point/Island	Water line/label/Default	City large scale/town large
Water point/Dam or weir	Indigenous/label/Default	City large scale/small
Water point/Playa	Military/label/Default	City large scale/medium
Water point/Canal or ditch	Continent	City large scale/large
Water point/Stream or river	Admin1 forest or park/label/Default	City large scale/x large
Water point/Lake or reservoir	Admin0 forest or park/label/Default	

"text-field": "{_name}" to "text-field": "{_name_zh_s}". For French, "text-field": "{_name_fr}", and so on.

Water line large scale/label/Default	Admin1 area/label/x small	City small scale/medium admin0 capital
Water line medium scale/label/Default	Admin1 area/label/small	City small scale/large other capital
Water line small scale/label/Default	Admin1 area/label/medium	City small scale/x large admin2 capital
Water area/label/Dam or weir	Admin1 area/label/large	City small scale/large non capital
Water area/label/Playa	Admin1 area/label/x large	City small scale/large admin0 capital
Water area/label/Canal or ditch	Admin1 area/label/2x large	City small scale/x large non capital
Water area/label/Small river	City small scale/town small non capital	City small scale/x large admin1 capital
Water area/label/Large river	City small scale/town large non capital	City small scale/x large admin0 capital
Water area/label/Small lake or reservoir	City small scale/small non capital	Landform/label/Round small
Water area/label/Large lake or reservoir	City small scale/medium non capital	Landform/label/Round medium
Water area/label/Bay or inlet	City small scale/other capital	Landform/label/Round large
Water area/label/Small island	City small scale/town large other capital	Landform/label/Round x large
Water area/label/Large island	City small scale/small other capital	Landform/label/Round small
Water area large scale/label/River	City small scale/medium other capital	Landform/label/Round small point
Water area large scale/label/Lake or lake intermittent	Admin0 point/x small	Landform/label/Round medium
Water area medium scale/label/Default	Admin0 point/small	Landform/label/Oblong medium point
Water area small scale/label/Default	Admin0 point/medium	Landform/label/Oblong large
Marine waterbody/label/small	Admin0 point/large	Landform/label/Oblong large point
Marine waterbody/label/medium	Admin0 point/x large	Landform/label/Oblong x large
Marine waterbody/label/large	Admin0 point/2x large	Landform/label/Oblong x large point
Marine waterbody/label/x large	City small scale/town small admin0 capital	Disputed label point/Island
Marine waterbody/label/2x large	City small scale/town large admin0 capital	Disputed label point/Waterbody
	City small scale/small admin0 capital	Disputed label point/Admin0

Large scale features

Apply JSON changes to the Small Scale Features first, see page 35. For Large Scale Features, the default JSON is "text-field": "{_name_global}" and displays labels in English. If you are changing the map to the local language within each country, where the data supports it, the JSON for these features changes to "text-field": "{_name_local}".

Find and replace "{_name_global}" with "{_name_local}" throughout the JSON file. Listed below are the 47 "id" fields in the streetmap style JSON available for local language within each country where the data supports it.

Other styles may have all or fewer of these features.

For example, "text-field": "{_name_global}" becomes "text-field": "{_name_local}".

Finance/label/Default	Trail or path/label/Default	Landmark/label/Default
Medical/label/Default	Road/label/Highway	Admin2 area/label/large
Marine area/label/Default	Golf course/label/Default	Road tunnel/label/Major
Road/label/Local	Point of interest/Rail station	
Emergency/label/Default	Road tunnel/label/Pedestrian	Water and wastewater/label/Default
Airport/label/Airport property	Road/label/FreewayMotorway	Openspace or forest/label/Default
Ferry/label/Rail ferry	Zoo/label/Default	Neighborhood
Road /label/Minor	Point of interest/General	Road tunnel/label/Highway
Transportation/label/Default	Road tunnel/label/Local	Port/label/Default
Exit/Default	Cemetery/label/Default	Park or farming/label/Default
Railroad/label/Default	Retail/label/Default	Building/label/Default
Road/label/Major	Admin2 area/label/small	Road tunnel/label/Freeway Motorway
Beach/label/Default	Road tunnel/label/Minor	Industry/label/Default
Point of interest/Bus station	Freight/label/Default	Point of interest/Park

There are other features on the map with "text-field": "{_name}" in the JSON file. These features do not support localization; do not change their JSON code for text-field.

Changing the font

It is recommended to change the fonts to Arial Unicode MS Regular or Arial Unicode MS Bold. There is no Italic. Esri Vector Basemap styles can have different default fonts. For example, the default fonts for streetmap style are Arial Bold, Arial Italic, and Arial Regular. For worldtopomap style, the default fonts are Noto Sans Bold, Noto Sans Italic, Noto Serif Regular, and Roboto Condensed Light. See page 31 for full listing of fonts available.

Additional JSON customization for Arabic language {_name_ar}: change these layers' "text-letter-spacing" to 0 (if not already set to this value).

Esri Vector Basemaps OpenStreetMap Daylight Distribution data sources

Esri is expanding coverage and content in its publicly available basemap services hosted on ArcGIS Online. To expand coverage at large scales globally, Esri is embracing the OpenStreetMap (OSM) community to supplement content and produce cartographic products in the ArcGIS Online Basemap cartographic styles. An important aspect of being part of the OSM community is abiding by its licensing and use guidelines when working with [OSM Daylight Distribution data](#). Esri took great care to ensure the process of obtaining and processing the OSM data is a “Trivial Transformation” for “Produced Works” served by Esri through the ArcGIS Online Platform.

In other words, Esri has not changed the source of the data in terms of its geometric representation or attribution but rather adjusted the geographic projection from WGS84 to Web Mercator Auxiliary Sphere and transformed features from the OSM format into the Esri Geodatabase model while preserving the original character values for feature labeling. More details on feature and the procedures Esri used to obtain OSM source, process the content to a rendering database, and produce a cartographic product are provided [at this link](#).

The current coverage of OSM Daylight data in Esri Vector Basemaps:

Localization of Esri OpenStreetMap Daylight Distribution vector tile maps

Esri publishes a set of basemap styles based on the Daylight Distribution of OpenStreetMap (OSM) data, separate from what the rest of this document discusses as “Esri Vector Basemaps”. These OSM maps can be [accessed through the Living Atlas](#). Some are also available through the ArcGIS Online basemap gallery. Localization is also available to change labels on the map for several small-scale features, where the data supports it. Localize the map by changing the "text-field" value of the map style's resources\styles\root.json file. Use the corresponding codes for the language you wish to display. It is also recommended to change all "text-font" to an Arial Unicode font (“Arial Unicode MS Regular” or “Arial Unicode MS Bold”) to allow all glyphs to display in the map or apply the Unicode font as part of a fallback font stack. After the localization changes are applied to your JSON, validate the file using <https://www.jsonlint.com> or a similar tool, and then update or upload the new localized map style as previously detailed in this reference document. The edits can also be applied on the JSON through the [Vector Tile Style Editor](#).

Languages and codes supported (40 to date).

Note: the codes for Chinese and Portuguese are different from Esri Vector Basemaps (page 35).

Features supported for Esri OSM Daylight basemap localization

The following features in the map style JSON can have their "text-field" values changed to support these languages. The map labels that support localization are primarily small-scale features. Apply the changes to the small-scale feature using a text editor, or the Esri Vector Tile Style Editor (edit JSON). Find "id" name in the style that matches the entry from the list below and change its "text-field" value accordingly from {_name} to {name_XX} where XX is one of the language codes from above. Other layers besides these six do not currently support localization changes. Do not change their text-field value.

- "capital"
- "place (high importance)"
- "administrative label/country"
- "administrative label/state"
- "administrative label/county level 5"
- "administrative label/county level 6"

Additional JSON customization for Arabic language {name_ar}: change these layers' "text-letter-spacing" to 0 (if not already set to this value).
