Settlement Points: These settlement points were created using OpenStreetMap (OSM) Building Footprints. Esri is a supporter of the OSM project, www.OpenStreetMap.org. The buildings were constrained to include only residential housing units. The buildings were verified and improved upon using the latest Esri imagery and HERE (Esri Street Map Premium Layers (LandArea, BuiltUpArea)). When necessary, household values were distributed evenly onto multiunit residential buildings using a top-down approach with the Michael Bauer Research household values from the lowest level geographies.

Change Notes

Market Data are now projections for 2022 (before: 2020). Unemployed persons are shown for 2021 (before 2019). Using new input data from the Census 2020 leads to deviations in the variables. The new projection for 2022 adjusted national population 15% downward based on the official input data of the Census 2020.

The updated settlement points have been constrained using current MBR boundaries. These settlement points could result in minor changes to previously run values in some trade areas. Settlement points are used in the data apportionment algorithm to redistribute data variables to input polygon features.
