## Create Custom GIS Desktop Applications

*Geographic analysis and spatial visualization improve operational efficiency, decision making, and problem solving. Software developers need the ability to build domain specific, easy-to-use applications that incorporate the power of geographic information system (GIS) technology into a focused, user-friendly experience.*

*ArcGIS® Engine is a new component framework in the ESRI® ArcGIS product family, created to embed spatial functionality in new or existing applications.*

*GIS clients can range from simple browser access to professional GIS desktops such as ArcView and ArcInfo.*

## Introducing ArcGIS Engine

ArcGIS Engine is a comprehensive set of core software components, tools, and resources packaged together for developers to build custom GIS and mapping applications. Developers can extend the object libraries and have complete control over the look and feel of their applications' user interfaces. ArcGIS Engine functionality can be either incidental to or central within an application. Applications can be deployed within the ArcGIS Engine framework, or developers can embed GIS functionality in other custom or commercial applications such as Microsoft® Word or Excel.

## ArcObjects: ArcGIS Software's Common Component Architecture

ArcGIS is an integrated family of GIS software products from ESRI that delivers complete, scalable GIS at the project, work group, and enterprise levels. It is based on a common library of shared software components called ArcObjects™. ArcObjects is composed of platform neutral C++ software objects that can run on Windows®, Linux®, and UNIX® platforms and have multiple developer application programming interfaces (APIs) including COM, .NET, Java™, and C++.

*"As a provider of software solutions for local government organizations and a current MapObjects® user, we were interested in trying out ArcGIS Engine. We believe there is a real need for comprehensive, embeddable GIS development platforms that allow for considerable flexibility in both form and function. ESRI is headed in the right direction with products, such as ArcGIS Engine, that will enable us to provide spatially enhanced applications that meet specific business processes."*

Brian Flood, President  
Spatial Data Logic

## Core ArcGIS Engine Functionality

### Map Creation

- Data display, multilayer data transparency, on-the-fly projections
- Data classification
- Symbology
- Labeling
- Layout and printing

### Map Interaction

- Panning and zooming
- Identifying
- Hyperlink to external applications or URL
- Interactive selection
- Spatial bookmarks

### Map Analysis

- Selection operations: interactive selection, select by attribute or location
- Analysis operations: buffer, clip, merge, intersect, union, spatial join

### Data Creation (shapefile and personal geodatabase)

- Editing shapefiles and personal geodatabase
- Rectification of images
- Geocoding and events
- Dynamic segmentation
- Read and write MXD files

### Developer Controls

- Map
- Page layout
- Reader
- Toolbar with tools and commands
- Table of contents
- Scene and globe (requires 3D extension)

## Use ArcGIS Engine To

- Embed GIS logic in custom industry applications.
- Efficiently build and deploy GIS applications.
- Provide access to advanced GIS logic from simplified applications.
- Embed GIS logic and maps in commercial applications such as Microsoft Word and Excel.
- Build cross platform applications with C++ or Java.

## ArcGIS Engine Developer Resources Include

- ESRI Developer Network (EDN) Program
- Developer help system
- Developer guide online book series
- ESRI support center
- Training classes

## ArcGIS Engine Developer Kit and Runtime

ArcGIS Engine consists of two products: a software development kit to build applications and a redistributable runtime to enable execution of the completed applications. The ArcGIS Engine Developer Kit is a components-based software development product for building custom GIS and mapping applications. The ArcGIS Engine Developer Kit is not an end user product but rather a toolkit for application developers, suitable for building basic mapping and comprehensive, dynamic GIS applications for Windows, UNIX, or Linux users.

ArcGIS Engine Runtime contains the core ArcObjects components to enable the execution of the end user application and needs to be installed on each computer that is running an ArcGIS Engine application.

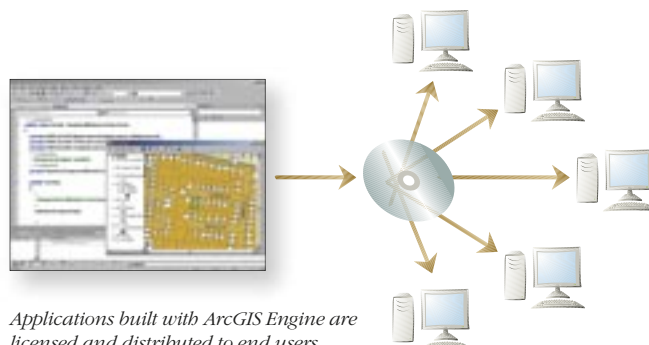

## Building Applications With ArcGIS Engine

Developers build ArcGIS Engine applications in their chosen integrated development environment (IDE) such as

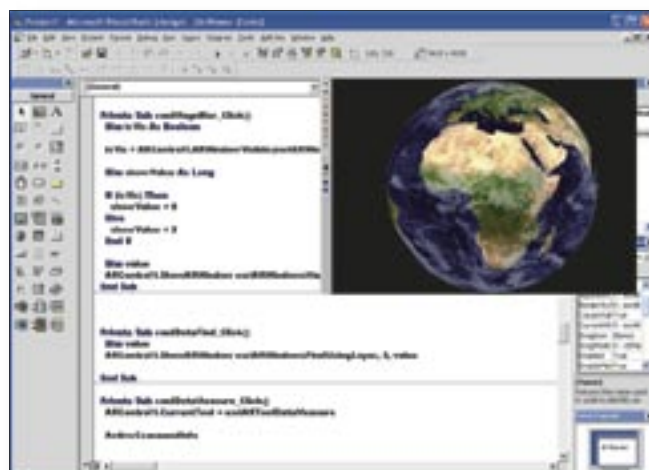

- Microsoft Visual Basic® (VB) and Visual Studio .NET
- Eclipse, Sun™ ONE Studio, and Borland® JBuilder® for Java developers

Developers register the ArcGIS Engine Developer Kit components with their IDE, as illustrated here in JBuilder, then create form-based applications, adding ArcGIS Engine components and writing code to build their applications.

For example, a VB developer can build a focused GIS mapping application by adding a map control, a table of contents control, and selected toolbars to the application. The finished application can then be installed on any ArcGIS Engine Runtime seat (including ArcGIS Desktop seats) for deployment.

## Deploying ArcGIS Engine Applications

All applications built with the ArcGIS Engine Developer Kit will need ArcGIS Engine Runtime or an ArcGIS Desktop product (ArcView®, ArcEditor™, or ArcInfo®) to execute successfully. The creator of an application can deliver ArcGIS Engine Runtime software integrated with the executable code or request the end user to license the ArcGIS Engine Runtime software directly from ESRI.

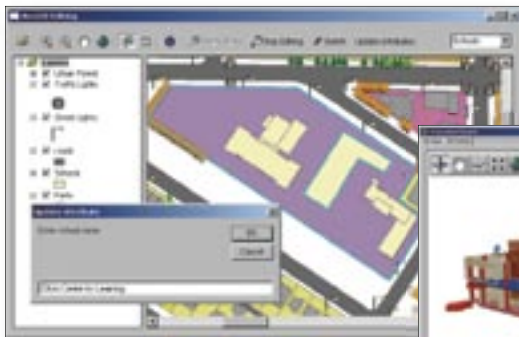

The standard ArcGIS Engine Runtime provides the core functionality of all ArcGIS products and can be enhanced with

- Geodatabase Update extension for full read–write access to a multiuser geodatabase
- 3D extension for advanced 3D visualization
- Spatial extension for complex spatial analysis
- Network extension for routing and network-based analysis

The details of ArcGIS Engine Runtime licensing will vary with the functionality used in a deployed application. For example, if the completed application performs 3D analysis, ArcGIS Engine Runtime needs to include the 3D extension. If there is already an ArcGIS Desktop product on the target computer, it needs an ArcGIS 3D Analyst™ extension license.

*"We are using ArcGIS Engine to build field-based applications providing disconnected geodatabase editing. Woolpert and our clients must produce high-quality data, and using these kinds of applications on tablet PCs with ink technology will help achieve our goals in a cost-effective manner. The user interface for these applications is simple, user-friendly, and targeted to the job. ArcGIS Engine allows us to do that. I have used ArcObjects since version 8.0 and am pleased with its evolution and the fact that my 8.x custom code is working in ArcGIS Engine."*

Woolpert LLP

For more than 35 years ESRI has been helping people manage and analyze geographic information. ESRI offers a framework for implementing GIS technology in any organization with a seamless link from personal GIS on the desktop to enterprisewide GIS client/server and data management systems. ESRI GIS solutions are flexible and can be customized to meet the needs of our users. ESRI is a full-service GIS company, ready to help you begin, grow, and build success with GIS.
